Event Scout: Components Map

Finds industry events for Vikram, ranks them, flags deadlines and emails him every Monday.

Live app: **event-scout-five.vercel.app**
Code: **github.com/vyombhatnagar-lgtm/event-scout**

1 Event Sources

Eventbrite, Luma, Meetup and AllEvents, plus any event link Vikram pastes in.

Why: events are scattered across many sites, so we collect them in one place.

→

2 Discovery Engine

Fetches events every day, cleans them into one format and removes duplicates.

Why: the same event is often listed on two or three sites.

→

3 Deadline Check

Reads the registration closing date from the event page. Under 7 days is marked urgent.

Why: Vikram's main problem was missing deadlines. We never guess a date.

↓

4 AI: Gemini Flash

Summarises each event and gives a fit score from 0 to 100 with a one line reason.

Why: required by the brief. AI output is checked against the source text.

←

5 Ranking

Final score = 35% Vikram's preferences (cities, topics) + 65% Gemini's score.

Why: fixed rules keep it consistent; AI adds judgement about the audience.

←

6 Database (Neon)

Stores events, scores, Vikram's preferences and his tasks.

Why: preferences can change without touching code, and nothing is lost between weeks.

↓

7 Scheduler (Vercel Cron)

Runs discovery daily at 5:00 AM and sends the briefing every Monday at 6:30 AM.

Why: it runs on its own, so Vikram does not have to do anything.

→

8 Monday Email (Resend)

Urgent deadlines first, then the best matches, each with register and calendar links.

Why: replaces his 45 minutes of manual searching every Monday.

→

9 Dashboard (Next.js on Vercel)

Today view, Explore, My events and Settings. Save, register, add to calendar, track tasks.

Why: one place to decide quickly and follow up through the week.

Built with Next.js · Neon · Gemini Flash · Resend · Vercel · GitHub
